### REC\_DS using C\_Week 1\_COD\_Question 3

Attempt : 3  
Total Mark : 10  
Marks Obtained : 10

#### Section 1 : Coding

##### 1. Problem Statement

Imagine you are working on a text processing tool and need to implement a feature that allows users to insert characters at a specific position.

Implement a program that takes user inputs to create a singly linked list of characters and inserts a new character after a given index in the list.

##### ***Input Format***

The first line of input consists of an integer N, representing the number of characters in the linked list.

The second line consists of a sequence of N characters, representing the linked list.

The third line consists of an integer index, representing the index(0-based) after

which the new character node needs to be inserted.

The fourth line consists of a character value representing the character to be inserted after the given index.

### ***Output Format***

If the provided index is out of bounds (larger than the list size):

1. The first line of output prints "Invalid index".
2. The second line prints "Updated list: " followed by the unchanged linked list values.

Otherwise, the output prints "Updated list: " followed by the updated linked list after inserting the new character after the given index.

Refer to the sample output for formatting specifications.

### ***Sample Test Case***

Input: 5

a b c d e

2

X

Output: Updated list: a b c X d e

### ***Answer***

```
// You are using GCC
#include<stdio.h>
#include<stdlib.h>
struct node{
    char ch;
    struct node*Next;
};
typedef struct node Node;
void InsertLast(Node*List,char);
void insertmid(Node*List,int,char);
void traverse(Node*List);
Node*Find(Node*List,int);
```

```

int main()
{
    int n,ind;
    char e,ne;
    scanf("%d",&n);
    Node*List=(Node*)malloc(sizeof(Node));
    List->Next=NULL;
    for(int i=0;i<n;i++)
    {
        scanf(" %c",&e);
        InsertLast(List,e);
    }
    scanf("%d",&ind);
    scanf(" %c",&ne);
    insertmid(List,ind,ne);
    traverse(List);
    return 0;
}

Node*Find(Node*List,int ind)
{
    Node*position=List->Next;
    int i=0;
    while(position!=NULL && i<ind)
    {
        position=position->Next;
        i++;
    }
    return position;
}

void InsertLast(Node*List,char e)
{
    Node*Newnode=(Node*)malloc(sizeof(Node));
    Node*Position;
    Newnode->ch=e;
    Newnode->Next=NULL;
    if(List->Next==NULL)
    {
        List->Next=Newnode;
    }
    else
    {
        Position=List;

```

```

        while(Position->Next!=NULL)
        {
            Position=Position->Next;
        }
        Position->Next=Newnode;
    }
}
void insertmid(Node*List,int ind,char ne)
{
    Node*Newnode=(Node*)malloc(sizeof(Node));
    Node*Position=Find(List,ind);
    if(Position==NULL)
    {
        printf("Invalid index\n");
        return;
    }
    Newnode->ch=ne;
    Newnode->Next=Position->Next;
    Position->Next=Newnode;
}
void traverse(Node*List)
{
    Node*Position=List;
    printf("Updated List: ");
    while(Position->Next!=NULL)
    {
        Position=Position->Next;
        printf("%c ",Position->ch);
    }
    printf("\n");
}

```

**Status :** Correct

**Marks :** 10/10
